

Spare Bungee Kit

Instructions For Use

www.XSscuba.com

Use this kit to build replacement bungee hold-downs or different length bungee hold-downs for your UFO.

Kit Contents:

- 98 in. (249 cm) bungee cord
- 7 plastic pull bobs

Instructions:

Most users will want to make 6 hold-downs (three for each side of your UFO). The 7th pull bob is a spare. A typical hold-down will use 12 in (30.5 cm) of bungee cord, but you may want to make longer or shorter ones depending upon your applications.

To make a bungee hold-down, cut the desired length of bungee. Feed each end through the small hole in the pull bob. Melt the ends with a lighter to prevent fraying. Tie a simple overhand knot. This is the same as the first step in tying your shoe. Pinch the two loose ends together while you pull the bungee back through the pull bob. Guide the overhand knot into the recess in the pull bob. The two loose ends of the bungee should be facing up (Fig. 1a-1d). Test your

work by pulling on the bungee loop to make sure that the knot is secure in the pull bob.

Install the bungee hold-downs by inserting the loop through the D-ring and then feeding the pull bob back through the loop (Fig 2a, 2b). The recommended location for the hold-downs are the 6 lower D-rings along the sides.
